

Visual context for buyer questions, not property-quality evidence.

Main takeaway: visible field variation can frame smarter buyer follow-up; it does not prove productivity, water rights, income, or value.

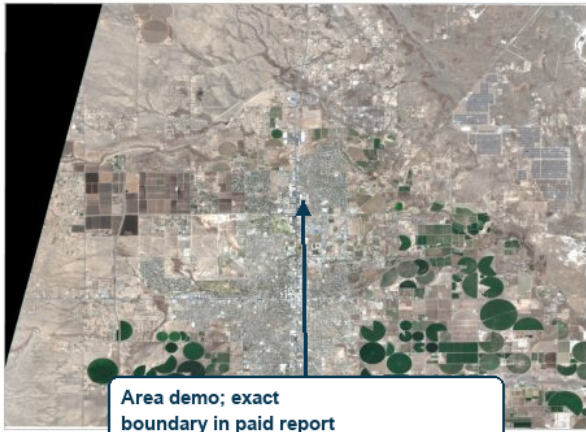

Field
Roswell NM farmland area -
variability demo

Signal
Mixed vegetation signal

Date
Sentinel-2 visual: 2026-03-25

Boundary
Area-level demo; paid: exact
boundary

RGB satellite view

Vegetation signal

Observed patterns

- Mixed vegetation signal is visible across the demo farmland area.
- Lower-signal zones give the buyer concrete areas to ask about or verify.
- The visual can support the next conversation without making property-quality claims.

Questions to check

- Does the listing description match the crop/irrigation story shown here?
- What irrigation, water, lease, or operator facts should the buyer verify?
- Should the final report use official parcel boundaries instead of a demo boundary?

How to use this

- Use after buyer interest to explain field history and visible patterns.
- Attach as light due-diligence context, not property-quality evidence.
- Use the questions below to guide buyer/operator follow-up.

What paid version adds

- Exact field or parcel boundary, not area-level demo.
- Time series for the selected field.
- Source/date/boundary notes for defensibility.

Guardrail: Do not promise higher sale price, faster sale, or investment quality.

Limits

Demo sample only. Shows satellite-visible property context and buyer questions for further review. Not evidence of productivity, water rights, lease status, income, soil quality, field status, value, or sale price.
